Spence NTD600 Series Thermodynamic Steam Trap

Figure 1. NTD600 Series Thermodynamic Steam Trap

Introduction

The NTD600 Series is a thermodynamic design steam trap. Body is an all stainless construction and hardened throughout. Seat is integral to body. Cover seals to body without gaskets or seals. Trap is suitable for pressures through 600 psi / 41.3 bar and available in NPS 3/8 to 1 / DN 10 to 25.

Features

- **Compact Design** Hardened stainless steel disk is the only moving part.
- **Inexpensive** Low initial cost is less expensive than repairable technologies.

- **Simplifies Installation** Works in vertical or horizontal position.
- Rugged Handles water hammer and superheat.
- Reliable, Efficient Operation Blast discharge helps to eliminate dirt buildup and provides tight shutoff.
- Freeze Resistant Self draining design prevents freezing.
- All Stainless Steel Construction Resists both internal and external corrosion.
- **Easy to Monitor** Audible discharge cycle makes checking operation simple.

Specifications

The specifications section on this page provides the ratings and other specifications for the NTD600 Series.

Available Configurations

Type NTD600: Thermodynamic Disk Trap Type NTD600S: Type NTD600 with integral strainer Type NTD600B: Type NTD600S with blowdown valve

Pressure Range⁽¹⁾ 2 to 600 psig / 0.14 to 41.3 barg

Maximum Operating Pressure⁽¹⁾ 600 psig / 41.3 barg

Maximum Operating Temperature⁽¹⁾ 800°F / 426°C

Maximum Allowable Pressure⁽¹⁾ 600 psig / 41.3 barg

1. The pressure/temperature limits in this Bulletin and any applicable standard or code limitation should not be exceeded.

Principle of Operation

Incoming air and condensate flow through the trap body and into the control chamber. Line pressure raises the disk off the seat allowing complete discharge. When flashing condensate enters the cartridge, flow velocity increases, creating low pressure underneath the disk. Flashing condensate at high velocity strikes the inside wall of the disk chamber and is deflected to the top of the disk causing a pressure buildup. The disk is forced down onto the seat by this pressure imbalance. The trap remains closed as flashed vapor in the control chamber keeps the disk seated. Pressure inside the cap is not lowered until the trapped flash vapor condenses due to body radiation. Condensing steam lowers the pressure above the disk. Disk is then lifted and the cycle repeated.

Installation

- 1. Before installing trap, blow all dirt and scale from apparatus and piping.
- 2. Install trap with arrow on body in flow line as close as possible to apparatus with strainer and valve upstream of trap.
- 3. Pitch all drain lines toward trap.

Maximum Allowable Temperature⁽¹⁾

Body: 420F Stainless steel

0.8 to 3.1 lbs / 0.36 to 1.8 kg

Screen: Stainless steel

Cap and Disk: 416 Stainless steel

Blowdown Valve: 304/316 Stainless steel

800°F / 426°C

Maximum Capacity

See Tables 1 and 2

Materials of Construction

Approximate Weights

Note

Approved practice is to install separate traps on each piece of apparatus to be drained. Steam supplied to inlets of several units may be of uniform pressure, but invariably there is a differential at the outlets. Although this differential may be small, unit discharging highest pressure will control the action of trap, while other units become air-bound and waterlogged.

Piping upstream and downstream of trap should be at least equal to or one size larger than trap connection.

- 4. Retighten cap screws of all socket weld traps after field or shop welding.
- Record the location of the trap for maintenance accessibility.

Capacity

The NTD600 Series steam trap works efficiently at all line pressures between 2 and 600 psi / 0.14 and 41.3 bar and back pressures to 80% of line pressure.

Ordering Information

When ordering, complete the ordering guide on this page. Refer to the Specifications section. Review the description to the right of each specification and the information in each referenced table or figure. Specify your choice whenever a selection is offered.
